Training run report: data160k-b8-t1024-e512h8-40k-lr6e-4-wu256k

Run `20260930-062056-2f30023-data160k-b8-t1024-e512h8-40k-lr6e-4-wu256k` · checkpoint `modal_data160k-b8-t1024-e512h8-40k-lr6e-4-wu256k_steps40000_seed42.pt` · generated 2026-10-09 17:20 UTC. A decoder-only Transformer language model (GPT-2 tokenizer, 50,257 tokens) trained from scratch; every number below is from the project's fixed evaluation harness, identical across models. Lower loss is better; the glossary at the end defines each metric.

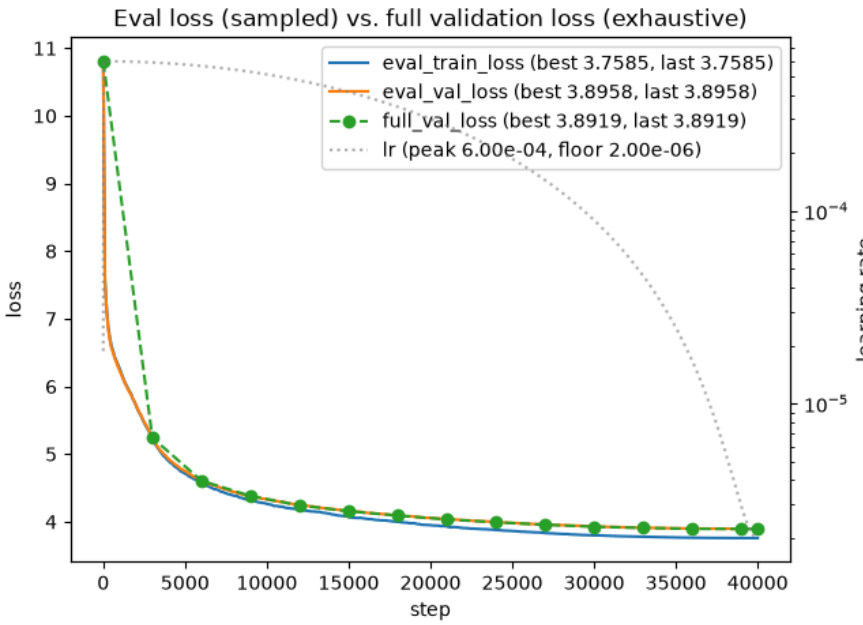

Headline

metric	value

Dataset: data160k

````
# data160k

Built 2026-09-28. Train is new; **val is data20k's, byte for byte**, the same
measuring stick as data20k, data40k and data80k.

| file | tokens | docs | sha256 |
|---|---|---|---|
| train.pt | 159,204,972 | 160,000 | `c6d7fe4a8f0cabd74b6a9b8f632c586fc0733986a238e003eff6a8c1a77e0a18`
|
| val.pt | 918,728 | 937 | `28b1041acaa527ac6d7e0a464b07115e766c5bf76252ecbc56a8519de02569ee` |

How it was made:

```bash
uv run mini-llm-prepare-data --num-examples 160000 --val-examples 1 --seed 0 --out-dir <tmp>
# keep <tmp>/train.pt; discard its 1-doc val
cp -p data/data20k/val.pt data/data160k/val.pt
```

Verified:
- data80k/train.pt is an exact prefix of data160k/train.pt (one seed-0 scan
  order: 20k ⊂ 40k ⊂ 80k ⊂ 160k).
- val.pt is identical to data20k/val.pt.
- 0 of the 937 val docs appear in train.pt
  (`python -m mini_llm.token_overlap data/data160k/val.pt --exclude data/data160k/train.pt`).

At the 122.88M-token budget (B64 × T128 × 15K) this is ~0.77 passes. Batches
are random crops drawn with replacement, so that still means only ~54% of
train tokens are ever seen, and ~30% of presentations are repeats.
````

Glossary

metric	meaning
full_val@c	Mean next-token loss (nats) over every token of the fixed 918,728-token validation set, in windows of c tokens. Lower is better. full_val@1024 is the headline number.
L(c)	Fixed-target context curve: loss on the same 8,000 target tokens given exactly c tokens of history. Comparable across models at equal c.
cb@W	Context benefit: loss with the real preceding W/2 tokens vs. a prefix from a different document, on identical windows. Nats of help from relevant context (± standard error).
retrieval@d	Forced choice among 10 candidates (chance 10%): can the model pick the token that appeared d tokens earlier? Tests using information far back in context.
degenerate	Samples (of 100) that end in an exact loop OR have rep4 >= 0.5, with its 95% CI. The headline repetition number: exact loops alone miss repetition that never settles into a verbatim cycle.
rep4	Share of repeated 4-grams in a generated sample (0 = no repetition). Median over 100 samples; also counted at >= 0.3 / 0.5 / 0.7.
near-loops	Samples whose tail repeats: from some token on, every 64-token window has rep4 >= 0.5. Onset = where that tail starts (median).
exact loops	Samples (of 100) that end in a verbatim repeating cycle of at least 32 tokens, with its 95% CI. A strict subset of the degenerate samples.
topic held	Share of samples still mentioning the prompt's subject near the end of the 256-token generation.
distinct-2 / -4	Distinct bigrams / 4-grams over total, a diversity measure.
generation protocol	20 frozen prompts x 5 seeds, 256 new tokens, temperature 0.7, top-k 40, stop at EOS; identical for every model.

Photosynthesis is a process that begins in cells, then, in order for the organism to survive. When the cells are free of charge, the cells will convert the cellular energy through the cells.
In order to survive, an organism needs to be able to survive, but it needs to be able to survive. For example, if the organism does not use water, the organism will begin to lose weight. In order to survive, the organism needs to be able to survive.
A new study has found that living cells that have the same energy for survival are not able to survive. This is due to the fact that the organisms may survive, but they do not survive. Humans may not survive, but they have to survive.
Some of the most common causes of death in humans include:
- In general, the organism will have to survive, and the organism will have to survive.
- In general, the organism will survive and survive, and it will eventually survive.
- In general, the organism will survive, and the organism will survive.
- In general, the organism will survive.

Photosynthesis is a process that involves making the cells and cells more resistant to stress. A study
published in Nature suggests that the cells could be more resistant to stress than the cells. It is
also important to know that a person has a higher chance of being exposed to stress than the cells.
In short, the researchers found that some of the cells that were exposed to stress in plants were
exposed to stress, or that they could not be able to control them. It was not surprising that a person
with an autoimmune disease caused a significant amount of damage to their immune system. It was more
likely that the cells were exposed to stress than those with an autoimmune disease.
The researchers found that in the brain cells were more resistant to stress than those with the
autoimmune disease, and these cells were more resistant to stress, which could lead to more stress.
The study also found that the cells in the brain were more resistant to stress than those with the
autoimmune disease.
The study was published in Nature.

biography: “Albert Einstein was a German-born theoretical physicist who”

draw 1 · rep4 0.13 · not degenerate · topic lost

```
Albert Einstein was a German-born theoretical physicist who was not in favor of his own invention, he would have succeeded in a theoretical experiment to achieve a new experimental method for the first time in the world. He would have been able to achieve the quantum-distant future of Quantum Theory. The first time in Quantum Theory was the first time in the quantum-distant future. The first time in the quantum-distant future of Quantum Theory was one of the first practical discoveries within quantum physics.
In his book ‘Ferdinand’, the first quantum field experiment was published in Vienna, Austria in 1961. The first published work in the world, In the Quantum-distant future, was published in the form of a ‘gold-type’ for the first time in the universe. In that paper, he published his work in the dark and in the dark and in the dark. The first quantum field experiment was published in Vienna in 1959, in 1961. In the second edition of this article, the first published work in the world, in 1954, was published between 1962 and 1963.
The second edition was published in 1955. The first version is published in 1968, during which the author is published in 1961. The second edition is published in 1964, in which the author is not published

Albert Einstein was a German-born theoretical physicist who became the first physicist, born in 1943.
Einstein's life was a very simple concept, and his ideas were developed.
He was a gifted scientist and physicist who became the first doctor of physics from the 13th-century,
who led the discovery of the first atomic bomb. He studied the atomic-bombing of a bomb in 1873. In
1936, he began an experiment called a "bombing of a bomb" and he was credited with being a "bombing of
a bomb" and was a "bombing of a bomb, and a bomb" and was a "bombing of a bomb".
In 1935, Einstein began a work of "bombing of a bomb" and, in 1935, a chemical bomb was discovered. He
was a physicist and physicist who developed the bomb. "He was a bomb," he wrote, "but it was a bomb."
In the late 1940's, Einstein had a bomb that was almost entirely random, but he was "bombing of a
bomb".
In the early 1950s, Einstein was an experimental physicist, who created a "bombing-bombing-bombing-
bombing-bombing-bombing-bombing-bombing-bombing-bombing-bombing-bombing-bomb

Oxygen is a chemical element with its name-name and its name, and is responsible for the synthesis of
glucose and a type of protein. A specific type of protein has its origins in the liver, and it is
usually used in the form of a protein called insulin.
The liver's function is also called insulin-dependent glucose. It is the primary source of glucose, and
it is the mainstay of the body. The mainstay of the body is the liver's primary source of glucose.
The primary source of glucose is triglycerides, which are stored in the blood vessels between the blood
vessels.
The liver is the central part of the body that stores glucose, which is the main source of glucose.
The liver stores glucose and is responsible for the production of glucose from the liver.
The liver has high blood glucose and is responsible for the production of glucose.
The liver's main source of glucose is glucose.
The liver stores glucose, which is the main source of glucose, and the main source of glucose.
The liver stores glucose, which is the main source of glucose.
The liver stores glucose, which is responsible for the production of glucose.

According to a study published in the journal Science.
While studying quantum mechanics, or quantum mechanics, quantum mechanics often come with a broad, specific field. These fields are characterized by a combination of quantum mechanics, the quantum field, and the ability to perform quantum mechanics while simultaneously addressing quantum mechanics.
To answer this question, researchers have developed a computerized quantum field that can solve quantum mechanics in a variety of mathematical and computer applications.
By using a quantum field, Quantum mechanics can be used as a computational power for a wide range of applications.
In physics, the basic principles governing quantum mechanics are of different types.
For quantum mechanics, the fundamental principle governing quantum mechanics with the aim of finding suitable experimental methods is to use quantum mechanics to determine the best possible applications.
For quantum mechanics, the fundamental principle governing quantum mechanics is to determine the best possible applications for quantum mechanics.
To understand quantum mechanics, we have developed a computerized quantum field model, based on a combination of classical physics, quantum mechanics, quantum mechanics, and other mathematical properties.
This is the first-ever study of quantum mechanics in the United States and the United States.
To test the validity of quantum mechanics, researchers are using a quantum-detection method that uses a quantum simulator to test the validity of quantum

The Amazon River flows through the Pacific Ocean through the Caribbean Sea.
The Pacific Ocean is a hotspot that is expected to reach 5,000 feet of oceanic surface at a time. The
ocean’s surface is about 1.5 miles (13.7 km) south. This is the average average sea level in the
Pacific Ocean near the coast of the United States. The average sea level in the Pacific Ocean shows the
largest surface area in the world, although the ocean has more than 1,800 feet, in the Pacific Ocean.
The ocean of the ocean has a population of around 1.5 million people, making it one of the most
important regions in the world and is now the largest in the world.

The Amazon River flows through a high-resolution ocean-level, water-rich, and hydrocarbon-rich
reservoir, in which the Earth has been expanding. Over-watering water is typically water-rich, with the
ability to move water into a lake, and it is more likely to be transported to the reservoir, and the
ability to use it in a lake.
How to Measure A Water Supply in a Water Supply in a Water Supply
In the event of a water supply, the water supply is a critical component of the water supply. By using
a water supply, the water supply is an essential component of the water supply. When water is flowing,
it is transported through the reservoir, which is the source of water for the water.
The water supply is typically water-rich, where it flows through the reservoir, and the water is
transported through the reservoir. The water supply is typically water-rich, which carries the water,
and the water is transported through the reservoir. Water-rich reservoirs are typically water-rich,
which carries the water, making it suitable for irrigation purposes.
How to Measure A Water Supply in a Water Supply
One of the primary methods used to measure a water supply is the use of a water supply. The water
supply is typically water-rich

math_definition: “In mathematics, a prime number is”

draw 1 · rep4 0.423 · not degenerate · topic held

```
In mathematics, a prime number is not the same as the corresponding point value. Therefore, in
mathematics, a prime number is the area of the equation. Thus, if the value in a given equation is
equal to the area of the equation, then the equation is equal to the area of the equation. For every
vertex of the equation, the formula is equal to the area of the equation. Therefore, the equation can
be estimated using the formula.
In mathematics, we have to calculate the formula. In mathematics, the sum of the equation is equal to
the area of the equation. Now, the formula is equal to the area of the equation, in the formula, the
relationship between the number of the equation. Therefore, the formula is equal to the area of the
equation. Now, then, we have to calculate the area of the equation. Now, let’s assume that a given area
of the equation is equal to the area of the equation. Now, let’s assume that the area of the equation
is equal to the area of the equation, and then we have to calculate the area of the equation. Now, we
have to multiply the area of the equation by a point. Now, in this case, we have to multiply the area
of the equation by a point value.

In mathematics, a prime number is a single point, a single point, and a set of integers. This is the
standard of the equation. This can be used to create a new state of the equation or the equation.
So, the next time you multiply the numbers of integers, you can multiply the number of integers. This
helps to determine the relative number of integers.
Here's a great way to solve the equations:
The first step in solving the equation:
In our calculator, we'll show how many numbers we can multiply by the number of digits.
So, you can multiply the number of integers.
Then, we have to multiply the number of times we can multiply by the number of times we can multiply by

The internet began as a research project in the US, and in the early 1980s, the federal government
provided $100 million to make it their home.
In the 1950s, the Bureau of Labor Statistics was a $100 million loan that the first time a bank issued
$200 million in the US. The first half of the world's gross revenue was $2,000.
There were over 10,000 people in the United States, and nearly 50,000 Americans made their home in the
United States. That number is roughly $3,000, and now the U.S. government was nearly $1,000.
In a decade, the federal government was also a relatively new force in the United States. The federal
government had already adopted a system based on the state's gross revenue, and it was the first
federal government to run its own net in the United States. The federal government had already
established a system that would allow the federal government to run its own net out of control over
their own net.
The federal government had a single agency to control the system, and the federal government had a plan
for it. As it did, it had to build up its own net, and it was just a move to reduce the number of
people who have the federal government
