Training run report: data640k-b8-t1024-e768h12l8-160k-lr3e-4-wu256k-rope-fused

Run `20261008-184506-8bd2310-data640k-b8-t1024-e768h12l8-160k-lr3e-4-wu256k-rope-fused` · checkpoint `modal_data640k-b8-t1024-e768h12l8-160k-lr3e-4-wu256k-rope-fused_steps160000_seed42.pt` · generated 2026-10-09 17:21 UTC. A decoder-only Transformer language model (GPT-2 tokenizer, 50,257 tokens) trained from scratch; every number below is from the project's fixed evaluation harness, identical across models. Lower loss is better; the glossary at the end defines each metric.

Dataset: data640k

````
# data640k

Built 2026-10-02. Train is new; **val is data20k's, byte for byte**, the same
measuring stick as data20k, data40k, data80k, data160k and data320k.

| file | tokens | docs | sha256 |
|---|---|---|---|
| train.pt | 632,350,143 | 640,000 | `6cdba9bb31652e5e70cfcc141f2a2060fd39297e1547c68f8ace8583116fa12d` |
| val.pt | 918,728 | 937 | `28b1041acaa527ac6d7e0a464b07115e766c5bf76252ecbc56a8519de02569ee` |

How it was made:

```bash
uv run mini-llm-prepare-data --num-examples 640000 --val-examples 1 --seed 0 --out-dir <tmp>
# keep <tmp>/train.pt; discard its 1-doc val
cp -p data/data20k/val.pt data/data640k/val.pt
```

This is the first dataset that needed the streaming `prepare_dataset` (rows
tokenized during the scan into int32 chunks). The old version held every token
as a Python int, ~20+ GB at this size. Output is unchanged: a 2,000-doc run of
the new code is an exact prefix of data320k/train.pt, and train.pt here was
built with the same scan, split and tokenization.

Verified:
- data320k/train.pt is an exact prefix of data640k/train.pt (one seed-0 scan
  order: 20k ⊂ 40k ⊂ 80k ⊂ 160k ⊂ 320k ⊂ 640k).
- val.pt is identical to data20k/val.pt.
- 0 of the 937 val docs appear in train.pt
  (`python -m mini_llm.token_overlap data/data640k/val.pt --exclude data/data640k/train.pt`).

train.pt is 5.06 GB on disk (int64). Training memory-maps it by default, so it
needn't fit in RAM; Modal runs read it fully (`--tokens-in-ram`). Upload with
`uv run --group modal modal volume put wiki-llm-data data/data640k /data640k`.

At the 327.68M-token budget (B8 × T1024 × 40K) this is ~0.52 passes, against
~1.04 over data320k at the same budget.
````

Glossary

metric	meaning
full_val@c	Mean next-token loss (nats) over every token of the fixed 918,728-token validation set, in windows of c tokens. Lower is better. full_val@1024 is the headline number.
L(c)	Fixed-target context curve: loss on the same 8,000 target tokens given exactly c tokens of history. Comparable across models at equal c.
cb@W	Context benefit: loss with the real preceding W/2 tokens vs. a prefix from a different document, on identical windows. Nats of help from relevant context (± standard error).
retrieval@d	Forced choice among 10 candidates (chance 10%): can the model pick the token that appeared d tokens earlier? Tests using information far back in context.
degenerate	Samples (of 100) that end in an exact loop OR have rep4 >= 0.5, with its 95% CI. The headline repetition number: exact loops alone miss repetition that never settles into a verbatim cycle.
rep4	Share of repeated 4-grams in a generated sample (0 = no repetition). Median over 100 samples; also counted at >= 0.3 / 0.5 / 0.7.
near-loops	Samples whose tail repeats: from some token on, every 64-token window has rep4 >= 0.5. Onset = where that tail starts (median).
exact loops	Samples (of 100) that end in a verbatim repeating cycle of at least 32 tokens, with its 95% CI. A strict subset of the degenerate samples.
topic held	Share of samples still mentioning the prompt's subject near the end of the 256-token generation.
distinct-2 / -4	Distinct bigrams / 4-grams over total, a diversity measure.
generation protocol	20 frozen prompts x 5 seeds, 256 new tokens, temperature 0.7, top-k 40, stop at EOS; identical for every model.

```
Photosynthesis is a process that takes place in the cell respiration. The process occurs in the mitochondria,
but it is not a single process. In the mitochondria, the energy is turned into energy and the energy is
transferred to the cells through photosynthesis, which is a process of photosynthesis.
Photosynthesis happens in the mitochondria, but there are other processes that occur in the mitochondria. The
mitochondria are the single biggest body organelle and are responsible for the movement of energy through the
cell. They are responsible for making ATP and ATP from the sugar glucose and ATP from carbon dioxide, and the
energy stored in the mitochondria.
Photosynthetic organisms have photosynthetic organisms that use energy to convert that energy into chemical
energy.
Photosynthesis happens in the mitochondria, but the energy is transferred from the food chain to the cells.
The energy is transferred to the mitochondria. Photosynthesis takes place in the mitochondria, but the energy
is transferred to the cells.
Photosynthesis is the process of converting the energy from the food chain into chemical energy.

```
Photosynthesis is a process that involves the conversion of carbon dioxide into glucose and oxygen. A study
published in the Journal of the American Chemical Society found that in the lab, the plants with
photosynthesis were able to use a high amount of glucose and oxygen to produce ATP.
How did this happen?
The experiment was able to produce a high amount of ATP and a high amount of oxygen. The amount of ATP
required for photosynthesis is different from the amount of oxygen needed to produce ATP as the sugar glucose
cannot be converted to glucose in the same way as the sugar glucose is used for energy. The process is known
as photosynthesis and the amount of glucose needed to produce ATP is known as its efficiency.
What is photosynthesis?
Photosynthesis is the process where carbon dioxide is converted into energy from the sun’s energy source.
Photosynthesis has two main processes: photosynthesis and respiration.
- Photosynthesis is the process where one organism uses energy from the sun’s energy to produce carbohydrates
and oxygen for energy production.
- Photosynthesis is the process where carbon dioxide is used as energy to produce ATP.
What is photosynthesis?
Photosynthesis is the process where a plant uses carbon dioxide and water to process carbon dioxide and water
to make energy. Photosynthesis is

biography: “Albert Einstein was a German-born theoretical physicist who”

draw 1 · rep4 0.103 · not degenerate · topic held

```
Albert Einstein was a German-born theoretical physicist who was a leading physicist among other people,
especially in the post-war years of his life. Einstein received his doctorate in mathematics from the
University of Vienna, and his doctorate in physics from the University of Vienna. He also received a master's
degree in mathematics, which he later became famous in the field of thermodynamics.
Although Einstein was well-known for his contributions to physics, he was one of the most important
researchers in physics. He was especially important in the development of the modern world, and he was
responsible for the development of the modern quantum computer.
In the 1920s, Einstein was a German-born physicist, and he was a key figure in the development of the field
of quantum mechanics. He was also a student of Albert Einstein, and he was a key figure in the development of
the modern world.
In 1924, Einstein was awarded the Nobel Prize for Physics, and he was one of the greatest physicists of the
20th century. He was also a professor of chemistry and a naturalist.
He was also a member of the German Academy of Science, which was founded in 1900 as the German Scientific
Society.
Although he was a well-known scientist, he also authored several books, which were eventually published.
He was also

Albert Einstein was a German-born theoretical physicist who believed that the universe could be made from a mixture of atoms. He believed that, while it was impossible to determine the exact size of the universe, the result was the discovery of the existence of an inner universe. In the next chapter, we will examine Einstein's most famous work, Nature, and explain how it had a profound impact on our understanding of the universe.
1. What is the most important discovery of Einstein's theory?
The first one, Nature, was a mathematical model that showed that the universe exists only in a single, isolated region of space, or that the entire universe is composed of a single small region of space. According to Einstein, the universe is composed of a large number of small regions of space, and it is not possible to determine the exact size of the universe by simple mathematical models. The result of this mathematical model is a mathematical model that shows that the universe is composed of a large number of small regions of space, and the entire universe is composed of a large number of small regions of space. In this way, our understanding of the universe is based on the scientific method.
2. How does Einstein's theory explain the origins of the universe?
The theory of relativity, or Einstein'

Albert Einstein was a German-born theoretical physicist who became one of the foremost scientists of his day. He was particularly interested in the concept of atomic energy and the relativity of the universe. Einstein's early work on the concept of gravity and the theory of gravity and the theory of relativity were among his most important contributions.
After studying the theory of relativity, Einstein established his theories on the nature of light and the relativity of the universe. He developed his theory of relativity in 1911. The name Einstein's theory of gravity is "the theory of relativity" and is considered to be one of the most important scientific discoveries of his day.
He was also known for his work on relativity and the relativity of the universe. He was also considered a pioneer in the field of mathematical physics. He was also considered to be one of the most influential physicists of his day and was widely known for his contributions to the field of physics. Einstein was also known for his work on the theory of relativity.
During his lifetime, Einstein held several important positions during his lifetime. He was considered to be one of the most well-known figures of the 20th-century. He was known for his work on quantum mechanics and was also a supporter of the idea of relativity. He was known for his work on the theory

```
Albert Einstein was a German-born theoretical physicist who became the first person to understand the laws of quantum mechanics, which he called quantum mechanics. He was also the first person to write about the phenomenon of quantum vacuum. He was the first European to realize the concept of quantum vacuum and was also the first person to understand the concept of quantum vacuum.
The first quantum vacuum experiment was a breakthrough in the field of quantum mechanics. In 1859, Albert Einstein published the famous equation, "The Law of Conservation of Energy," which he named the law of conservation of energy. Albert Einstein's formula was the law of conservation of energy. He also proposed the law of conservation of energy. He proposed that the energy of a photon cannot be transferred from a distance. This law was later proved later in 1869.
In 1872, Albert Einstein led the first scientific research of the photon. He was a German physicist and Nobel Prize winner. He discovered the concept of quantum vacuum and named it the law of conservation of energy. He was also the first person to define the law of conservation of energy. He also founded the so-called "quantum optics" as a research area.
The discovery of the law of conservation of energy is one of the most important discoveries in physics. It is the

Oxygen is a chemical element with the symbol "LF"). The word "oxygen" is an acronym for "hydrogen". It is an electron in the periodic table. The number of molecules in the periodic table is often called the number of electrons in the periodic table. The number of electrons in the periodic table is the number of electrons in the periodic table. The number of electrons in the periodic table is very small. Therefore, the number of electrons in the periodic table is always less than the number of electrons in the periodic table.
The chemical element is often called a "particle". When the number of atoms in the periodic table is greater than the number of electrons in the periodic table, it is called a "electron". The number of electrons in the periodic table is usually less than the number of electrons in the periodic table.
The number of electrons in the periodic table is usually greater than the number of electrons in the periodic table. In addition, the number of electrons in the periodic table is often less than the number of electrons in the periodic table.
The periodic table is a type of periodic table containing only one element. It is the symbol for the periodic table.
If you want to learn about the periodic table, you can check out our article on the periodic table.

Although the treaty was signed in 1919, it took effect on January 16, 1919, when it was ratified by the
United States.
The United States entered World War I as a non-incessionally-minded nation in 1919. It was largely based on a
desire to secure victory. The Treaty of Versailles, signed on Dec. 7, 1919, gave the United States the
freedom to unilaterally exclude all other nations. It was also a pre-war effort to eliminate the U.S. from
the union.
The treaty also put into effect a law that prohibited the use of the United States' military or naval
resources, which were not considered to be essential for the United States to exist.
The Treaty of Versailles was ratified on May 11, 1919. The treaty was signed on May 11, 1919, taking effect
on May 11, 1919.
The Treaty of Versailles was signed on May 17, 1919, which was ratified on May 10, 1919.
The treaty, signed on May 17, 1919, would be ratified on July 20, 1919.
The Treaty of Versailles was signed on April 15, 1919, taking effect on March 21, 1919, when the United
States entered World War I.
The treaty came into effect on May 13, 1919, as

According to a study published in the journal Nature, this study confirmed that the amount of water in the
ocean is not a factor in the production of salt in the ocean, but instead a factor in the increase in the
size of the ocean, as well as the concentration of salt in the ocean.
In the study, the researchers found that a large proportion of the water in the ocean is salty, and salt is a
major factor in the growth of the ocean.
“In the ocean, the water is salty and it can become salty as a result of the food chain,” said Dr. David L.
Gorman, a biologist at the University of Texas at Austin.
The researchers also found that the amount of water in the ocean is not a factor in the growth of the ocean,
so it is not a factor in the increase in the production of salt in the ocean.
“The salt in the ocean has a greater role in the formation of the water as a result of salt accumulation and
also contributes to the growth of the ocean,” said Dr. Gorman.
“Salmon and other freshwater species are important contributors to the ocean and the ocean ecosystem,
including the ocean floor.”
The study also showed that the ocean floor is not a factor

According to a study published in the Journal of Infectious Diseases in the journal, the number of cases of a
bacterial infection in hospitals in the United States is expected to continue to grow in the coming years.
“The most significant risk factor for a bacterial infection, including severe infections, is bacterial kidney
disease,” said the study’s lead author, Dr. Lassa D. W. Shetty, PhD, of the University Hospital of Pittsburgh
Medical Center, where he was part of the study.
“We believe that the risk of infection is reduced, but that the risk is reduced because it is very high.”
The results of the study highlight the importance of a culture-free approach for preventing bacterial
infection.
“This is one of the great advances in the field of medicine,” said Dr. W. Shetty, professor of microbiology
at the University of Pittsburgh Medical Center. “The technique is simple and safe.”

According to a study published in the journal Nutrients International, some experts suggest that the plant may have a beneficial effect on the growth.
Researchers from the University of Illinois at Chicago conducted the experiment and found that the plant was able to increase the number of mitochondria in the leaves of the plant.
“The plant has a very strong and high metabolic rate, which makes it one of the best sources of plant energy,” said study co-author Dr. Charles J. Gennedy. “The plant has the ability to produce energy for many applications, including food and beverages.”
The plant also has a high percentage of natural antioxidants, which will help protect the body against oxidative stress and help reduce the risk of heart disease.
This is a very important step for the future of the plant.
The plant is also known for the health benefits it provides by promoting the production of antioxidants.
“In this study, plant is being tested in a number of countries,” said study co-author Dr. Charles J. Gennedy. “They also tested their benefits in several different countries.”
While the plant is considered the best source of plant energy, the plant has a high concentration of nutrients, such as Vitamin A and B6

According to a study published in The British Medical Journal, in the 1980s, women who had been diagnosed with HIV at age 50 or older were more likely to have a positive pregnancy test and thus had lower blood levels of the virus.
A second study published in the American Journal of Obstetrics & Gynecology (AAC) found that HIV was associated with higher levels of “severe negative pregnancy”.
These findings, along with the findings of other researchers, suggest that women who had been diagnosed with HIV during pregnancy may have higher rates of negative pregnancy.
The study authors claim that women who had been diagnosed with HIV during pregnancy are at a higher risk of having a positive pregnancy test and therefore, be advised to take HIV prevention education.
The study has found that women who had been diagnosed with HIV during pregnancy had lower rates of negative pregnancy tests and also had higher rates of negative pregnancy tests.
This study is important because it is a great way to understand the risks of HIV-positive pregnant women and the long-term benefits of using a condom during pregnancy.

anatomy: "The human heart is a muscular organ that"

draw 1 · rep4 0.142 · not degenerate · topic held

```
The human heart is a muscular organ that works in two different ways. The human heart beats with a certain amount of force applied to the body's cells. The heart also pumps blood through the vessels, which are called aortic and pulmonary arteries. The heart beats mechanically with blood flowing through the heart's valves, and the heart pumps the blood out of the body.
The heart is a very complex organ, and the body needs the right amount of oxygen to sustain its functions. Without oxygen, all the cells in the body will die.
How Do You Replace a Heart?
There are two common ways to replace a heart. One is by replacing the damaged part of the heart (usually aortic and pulmonary arteries), while the other is by replacing the damaged part.
You may be able to replace the damaged part of the heart with a new one, or you may be able to replace the damaged part using a different type of blood vessel.
What are the Different Types of Heart?
There are many different types of heart, and each has its own unique benefits and uses. There are many different types of heart, and each has its own benefits and uses.

The human heart is a muscular organ that has a strong center of gravity and is capable of generating all the forces necessary to support the body.
The heart is a complex system that requires two different forms:
1. The heart's pumping action, which in turn produces alternating electrical currents — the heart's pumping action (in electrical currents) and the heart's pumping action (in electrical currents).
The heart is made up of six chambers; the heart chambers are each a unique combination of the two chambers. Each chamber has a unique mechanical mechanism that allows the electrical current to flow through the heart. The heart also pumps blood through the heart to transport the blood from the lungs to the brain.
2. The heart's pumping action, which is a combination of electrical currents, is a key factor in the heart's pumping action.
The heart receives an electrical impulse that is activated by the blood, and the heart contracts to generate electrical energy — the electrical energy that drives the electrical activity of the heart.
This energy is then pumped to the heart to pump blood to the muscles of the heart.
The heart is an amazing system. It is made up of two chambers, one of the heart's pumping action (in electrical currents) and one

The human heart is a muscular organ that pumps oxygen and nutrients through the bloodstream to the body. The heart is primarily responsible for pumping blood into the lungs and filtering out carbon dioxide, the main greenhouse gas produced by the human body.
The kidneys, the muscles, and the liver are the organs that need the most energy. However, there are also other parts of the body that play a key role in regulating blood flow. Blood pressure and cholesterol levels are regulated by the heart.
The heart is a complex network of arteries that supply oxygen and nutrients to our body, the cells in the heart. The heart's main function is to pump blood to the lungs to supply oxygen and nutrients to the body. The heart also provides oxygen, blood to the brain and the rest of the body. It pumps oxygen throughout the body, helping to keep the blood flowing throughout the body.
The heart is a complex network of arteries that supply oxygen and nutrients to the body, such as the heart, lungs, and blood vessels.
The heart's main function is to pump blood to the lungs, where it is used to deliver oxygen and nutrients to the body's cells. The heart also pumps oxygen and nutrients to the lungs, where they are used to deliver oxygen and nutrients to the muscles,

```
The human heart is a muscular organ that enables the muscles to contract and contract with each heartbeat. The heart is designed to pump the blood, oxygen, and nutrients from the air.
The heart is the primary organ that helps keep the heart healthy. It is important for healthy heart function because it helps prevent the buildup of harmful toxins and toxins in the blood. Heart disease is the most common cause of premature death in the United States. Most people die from heart disease, but it can be prevented with good heart health habits.
In order for the heart to function properly, it needs the right blood vessels. The blood vessels in the heart need to work harder to keep the heart beating and to keep blood flowing, so the heart beats faster. The heart muscle cells need to contract to pump the blood, which is then pumped through the arteries to the brain. When the heart contracts, the blood flows into the brain, which is responsible for producing the electrical signals that signal the heart to pump the blood. The heart also needs to work harder to keep the blood flowing.
The heart needs to be able to pump blood from the lungs to the rest of the body. The heart also needs to work harder to keep the blood flowing. The heart needs to work harder to keep blood flowing, so it needs to work harder

Climate change refers to long-term shifts in climate and the ability of people to adapt to new climate conditions.
In addition to extreme weather, climate change is also a serious threat to the natural climate system and to vulnerable populations. Climate change has the potential to disrupt migration patterns in many parts of the world, including Asia, Africa and South America.
Climate change also has negative impacts on health and development, such as increased cancer risks and increased mortality rates in Europe and Asia.
Climate change can also have negative impacts on health and development. For example, climate change may cause economic loss in vulnerable regions, such as the UK, which is expected to double by 2050.
Climate change is also a serious threat to the natural world. For example, the effects of climate change are likely to be severe, including increased flooding and erosion.
Climate change also has many negative impacts on development and public health. For example, changes in the climate in Asia and Africa could lead to increased vulnerability to severe natural weather events, such as flooding.
Climate change can also have negative impacts on the health of individuals and communities. For example, it can increase the odds of heart attacks by increasing the risk of stroke and heart attacks by 90%, and can also cause premature death by 30%.
Climate change has also negative impacts on people

Climate change refers to long-term shifts in temperature and precipitation, which are often accompanied by extreme weather events, such as hurricanes and flooding.
Understanding Climate Change and its Impact on Climate
Climate change has affected the climate and how it impacts climate change. Climate change is also a major concern for individuals who rely on fossil fuels and natural gas to power their homes.
Climate change has already affected the temperature, water levels, and the amount of precipitation that has been captured and stored in the rivers and streams, and the amount of water that has been captured and stored to power our homes.
Climate change has also caused changes in precipitation patterns, such as the increased frequency of extreme weather events.
Climate change has also impacted the way we use energy and water. Climate change affects how energy is used, how it is used, and how it is distributed across the globe.
Climate change has also affected the way we approach our climate change understanding. Climate change is a complex phenomenon, and it can be complex and interdependent.
Climate change has also affected the way that we use energy, water, and other resources. Climate change is also affecting how we use energy, water, and other resources.

Climate change refers to long-term shifts in the Earth’s climate, but not to the impacts of climate change.
As the climate crisis shifts, the likelihood of the event happening outside the planet’s boundaries is projected to increase. As the climate warms, the risk of the event going up is predicted to increase.
The report noted that many of the world’s most vulnerable countries are facing a rapid increase in extreme weather events.
“We’ve seen the greatest increase in extreme weather events, such as tornadoes, floods and drought events, in the past decade,” said Dr. Peter Zuckerman, the Director of the National Oceanic and Atmospheric Administration’s Climate Change Adaptation and Mitigation Institute.
“We need to make these predictions more precise,” said Zuckerman.
Dr. Zuckerman said the report’s findings indicate that in the coming decades, most of the world’s developing countries will have to adapt to the climate crisis.
“The United States will be a net importer, but if this is not possible, we’ll be taking action to keep the world safe from the effects of climate change,” said Dr. Zuckerman.

William Shakespeare wrote many plays, including Shakespeare's Hamlet and the Merchant of Venice. Shakespeare was born in Stratford, England, in 1514, and his love affairs brought him to the attention of his contemporaries, notably Shakespeare and Samuel Lanfranco, who had been the subject of his plays. Shakespeare wrote more than half of his plays, including Hamlet and the Tempest, his most famous sonnets, and others, along with many of his many other plays.
Although the title was later changed to Hamlet, the character names were not given to the title until the 19th century. Hamlet’s play was not originally published until the 1920s. It was first published in the New York Times in 1929, and was published as a four-piece play by Shakespeare. It was written at the time of Shakespeare’s death in 1526.
Hamlet and the Tempest
Hamlet’s play was written in the late 1600s, when he was accused of being a “mad man” and was hanged for his crimes. He was accused of running for office and having two children, a son and a daughter. Hamlet was a nobleman, and he was the son of the wealthy king, King Hamlet, and a daughter of the king.

Inflation occurs when inflation is lower and the inflation rate is higher, and the economy is in the grip of inflation.
Gone are the days when unemployment was highest and inflation quickly began to rise.
Now, this is just one of the biggest shocks of the year, which is when inflation rises above the pre-pandemic level.
But this isn’t the only thing that causes inflation.
So, let’s take a look at three things that make inflation higher than inflation.
1. The inflation rate
If inflation is high, it means that the economy is in a recession. If inflation is high, people have low rates of unemployment.
So, inflation is the result of a combination of factors, including inflation, inflation, unemployment, and inflation.
Also, inflation is the result of a combination of factors.
2. The rate of unemployment
There are some factors that make inflation higher than inflation.
For example, the rate of unemployment in the UK is higher than inflation in the EU.
And, for more information about inflation, click here.
Inflation is the most important factor that causes inflation.
The reason being inflation is higher than inflation.
3. The unemployment rate
The unemployment rate is the most important
