Training run report: data640k-fw70edu30-b8-t1024-e768h12l8-160k-lr3e-4-wu256k-rope-fused

Run `20261009-073241-a1d6343-data640k-fw70edu30-b8-t1024-e768h12l8-160k-lr3e-4-wu256k-rope-fused` · checkpoint `modal_data640k-fw70edu30-b8-t1024-e768h12l8-160k-lr3e-4-wu256k-rope-fused_steps160000_seed42.pt` · generated 2026-10-09 17:21 UTC. A decoder-only Transformer language model (GPT-2 tokenizer, 50,257 tokens) trained from scratch; every number below is from the project's fixed evaluation harness, identical across models. Lower loss is better; the glossary at the end defines each metric.

Dataset: data640k-fw70edu30

````
# data640k-fw70edu30

Built 2026-10-09 on Modal (`src/mini_llm/remote/modal_prepare.py`, commit after 8171e40). A
breadth experiment: the same token budget as data640k, but 70% general FineWeb and 30% FineWeb-Edu
**by tokens**, instead of 100% FineWeb-Edu. **val.pt is data20k's, byte for byte**, the same
measuring stick as every dataset since data20k; val_mix.pt is this mixture's own val.

| file | tokens | docs | sha256 |
|---|---|---|---|
| train.pt | 633,453,440 | 830,000 | `06888cafcf8bba64afd1208b30a6ec281e76f99da3bc8e96900b4f6337692fe1` |
| val.pt | 918,728 | 937 | `28b1041acaa527ac6d7e0a464b07115e766c5bf76252ecbc56a8519de02569ee` |
| val_mix.pt | 919,373 | 1,220 | `6f6fa8c6c0d508a3b034e4c77e29170713f3d64285d74264e69d667a46c2762b` |

| source | train tokens | share | train docs | val_mix tokens | val_mix docs |
|---|---|---|---|---|---|
| HuggingFaceFW/fineweb : sample-10BT | 443,066,574 | 69.94% | 639,000 | 643,688 | 943 |
| HuggingFaceTB/smollm-corpus : fineweb-edu-dedup | 190,386,866 | 30.06% | 191,000 | 275,685 | 277 |

How it was made:

```bash
uv run --group modal modal run --detach src/mini_llm/remote/modal_prepare.py \
    --name data640k-fw70edu30 \
    --mix HuggingFaceFW/fineweb:sample-10BT=0.7,HuggingFaceTB/smollm-corpus:fineweb-edu-dedup=0.3 \
    --num-tokens 632350143 --val-num-tokens 918728
```

- Token quotas: 632,350,143 (data640k's train size) split 70/30; each source overshoots by under one
  1,000-doc tokenized batch (+0.17% in total). General FineWeb documents average ~690 tokens, Edu ~990,
  so document shares (77/23) differ from token shares.
- Same seed (0), shuffle buffer and content-hash train/val rule as every other dataset, so the Edu part
  is the first 191,000 train documents of the seed-0 Edu scan: a prefix of data640k/train.pt.
- Sources interleave in ~1,000-document runs, so any prefix of train.pt holds the mixture.
- Built on Modal because streaming general FineWeb spiked the Mac's build past 6 GB and macOS killed it.

Verified (in the build, which refuses to save otherwise; see mix.json):
- 0 of the 937 val.pt docs and 0 of the 1,220 val_mix.pt docs appear in train.pt (exact
  document hashes, mini_llm.token_overlap).
- val.pt == data/data20k/val.pt (cmp).

At B8 x T1024 x 160K steps (1.31B token presentations) this is ~2.07 passes, the same as data640k.
````

Glossary

metric	meaning
full_val@c	Mean next-token loss (nats) over every token of the fixed 918,728-token validation set, in windows of c tokens. Lower is better. full_val@1024 is the headline number.
L(c)	Fixed-target context curve: loss on the same 8,000 target tokens given exactly c tokens of history. Comparable across models at equal c.
cb@W	Context benefit: loss with the real preceding W/2 tokens vs. a prefix from a different document, on identical windows. Nats of help from relevant context (± standard error).
retrieval@d	Forced choice among 10 candidates (chance 10%): can the model pick the token that appeared d tokens earlier? Tests using information far back in context.
degenerate	Samples (of 100) that end in an exact loop OR have rep4 >= 0.5, with its 95% CI. The headline repetition number: exact loops alone miss repetition that never settles into a verbatim cycle.
rep4	Share of repeated 4-grams in a generated sample (0 = no repetition). Median over 100 samples; also counted at >= 0.3 / 0.5 / 0.7.
near-loops	Samples whose tail repeats: from some token on, every 64-token window has rep4 >= 0.5. Onset = where that tail starts (median).
exact loops	Samples (of 100) that end in a verbatim repeating cycle of at least 32 tokens, with its 95% CI. A strict subset of the degenerate samples.
topic held	Share of samples still mentioning the prompt's subject near the end of the 256-token generation.
distinct-2 / -4	Distinct bigrams / 4-grams over total, a diversity measure.
generation protocol	20 frozen prompts x 5 seeds, 256 new tokens, temperature 0.7, top-k 40, stop at EOS; identical for every model.

Appendix: all generation samples

definition: “Photosynthesis is a process that”

draw 1 · rep4 0.336 · not degenerate · topic lost

```
Photosynthesis is a process that we use as a way to slow down the production of chlorophyll.
The process is called chlorophyll production. The amount of chlorophyll produced from a plant depends on
the plant’s ability to absorb water. So, plants absorb water from the air, and they absorb nutrients from
the soil.
So, while the water is being absorbed through the plant, plants absorb water from the air. So, for
example, in the case of the plant, the water is absorbed through an organic compound called chlorophyll.
So, it is the water that leaves the plant.
Plant production plants need the water that is being used to make chlorophyll. The plant is also used for
chlorophyll production.
The process of reducing water to produce chlorophyll is called chlorophyll production. The process of
reducing water to produce chlorophyll is called chlorophyll production.
The process of reducing water to produce chlorophyll involves washing the water with soap. This soap is
then absorbed through the plant.
The process of reducing water to produce chlorophyll is called chlorophyll production.
The process of reducing water to produce chlorophyll is called chlorophyll production. The process of
reducing water to produce chlorophy

Photosynthesis is a process that begins in photosynthesis.
It is important to note that the photosynthesis process is the process by which a small molecule of glucose is converted into energy. This is called glucose uptake. The glucose from the glucose is converted into energy through photosynthesis.
The photosynthesis process is a process that occurs between photosynthesis and microorganisms. In microorganisms, microorganisms convert glucose into energy. They convert it into energy by photosynthesis.
The photosynthesis process is a process by which living cells convert glucose into energy. It is known as photosynthesis.
The photosynthesis process is the process by which living cells convert glucose into energy. When the glucose is converted to energy, it is converted to energy.
The photosynthesis process is a process by which living cells convert glucose into energy. When the glucose is converted into energy, the cells convert it into energy.
The photosynthesis process is a process by which living cells convert glucose into energy.
When the cells convert the energy from the glucose into energy, the cells convert it into energy.

Photosynthesis is a process that occurs after the sun has been removed from the earth’s surface. The process is called photobioreaction, and it is a process that occurs during the process of photosynthesis, which is the process of photosynthesis.
The photoynthesis process is a process that occurs during the stages of photosynthesis. Photosynthesis is a process that occurs after a chemical reaction occurs on the earth’s surface. Photosynthesis reactions occur during the process of photosynthesis.
The photosynthesis process is the process that occurs during photosynthesis. Photosynthesis is essential for the production of food and energy. Photosynthesis happens during the process of photosynthesis, and it’s called photosynthesis. Photosynthesis is a process that occurs during the process of photosynthesis.
The process of photosynthesis involves the use of photobioreaction. Photosynthesis involves the process of photosynthesis, which occurs after the sun has been removed from the earth and the sun is not visible.
The process of photosynthesis involves the process of photosynthesis. Photosynthesis is a process that occurs during the process of photosynthesis. Photosynthesis allows the water molecule to enter the water and convert it into water. Photosynthesis is a process that occurs during the process of photosynthesis.
The process of

biography: “Albert Einstein was a German-born theoretical physicist who”

draw 1 · rep4 0.324 · not degenerate · topic held

```
Albert Einstein was a German-born theoretical physicist who was not afraid of the laws of physics, but
would become a physicist after the discovery of the universe. Einstein was a naturalist. He made his
famous observations about the universe and how it came about. Einstein later published his famous
observations on the Universe and Einstein wrote, “I think you must be prepared to be a scientist.”
In his famous theory of relativity, Einstein was the first one to propose that the universe is composed
of two or more distinct types of particles. It is not so much that the universe is composed of two or
more particles, but that the particles in the universe are composed of two or more distinct types of
particles. Einstein proposed that the universe contains particles of two or more distinct types of
particles, and he proposed that the universe is composed of two or more distinct types of particles. The
universe is composed of three different types of particles:
- The particle of light
- The particle of light
- The particle of light
- The particle of heat
- The particle of heat
- The particle of light
The particle of light is a particle that is composed of two or more distinct types of particles. The
particle of light is a particle that is composed of two or more distinct types of particles.

Albert Einstein was a German-born theoretical physicist who was born in Germany, but he was raised in an
American university, and the physicist was often called the "neutron physicist".
He was born in Germany, on July 22, 1755, in a British town. He was born in Belgium, and he was raised
there.
At age 18, he joined the Nobel Committee in physics. He worked for the Royal Institution of Chartered
Surveyors in London, and worked for the Royal Mathematical Society in London.
In 1785, he became the first American scientist to study physics. He was a member of the Nobel Committee
and the first American to be admitted to the Royal Institution. He was accepted by a large number of
scientific institutions, including the Royal Science Society and the Royal Society of Chemistry.
The first American to be admitted to the Royal Institution was his brother, John, who was a chemist. He
was born in 1765 in York.
He was a member of the Royal Society of Chemistry and Physics, and a member of the Royal Society of
Chemistry. He was married to his late husband, Albert, in 1780.
In 1780, he was married to his late husband, Albert, in a British hospital. They were married on July 22,
1780, and they had

Albert Einstein was a German-born theoretical physicist who believed that the universe could be made from a mixture of atoms. He believed that, as a child, Einstein would be a great scientist.
In the late 1800s, Einstein proposed that the universe be made at random. He proposed that the universe be created when all particles of a mass of matter, called atoms, are created. His theory of gravity states that the universe has a force (the law) that is proportional to the mass of the universe.
He believed that, for the universe to be created, there must be a constant constant (the "neo-"), and that every atom of matter, called atoms, must be created. He believed that there must be a constant constant that is proportional to the mass of the universe. He believed that every atom of matter, called atoms, must be created by the same amount of mass of the universe.
In his famous book, "The Big Bang," Einstein proposed that the universe must be a large, continuous mass of matter. He believed that the universe is a great mass of matter, called a mass of matter. He believed that the universe must be a mass of matter, called a mass of matter, called a mass of matter.
He believed that the universe must be a large, continuous mass

Oxygen is a chemical element with a unique molecular and chemical structure that is used to make things work. It is produced by the chemical reaction of the gas produced by the gas. The energy is converted into electrical energy, and the chemical reaction is called hydrocarbon. When the gas is burned, it is used as a gas, and it is used as a gas.
The chemical reaction in the gas is caused by the reaction of gases, such as nitrogen, nitrogen, and sulfur. The gases in the gas are converted into electrical energy by the reaction of gases. The energy is converted into heat energy, which is used to produce electricity.
When a gas is burned, it is used as a gas, and it is used as a gas.
The gas is heated to a density of 20,000,000, which is then heated to a density of 4.7,000,000, which is then heated to a density of 4.5,000,000, which is then heated to a density of 5,000,000.
The gases in the gas are heated to a density of 3,000,000, which is then heated to a density of 4,000,000, which is then heated to a density of 5,000,000, which is then heated to

Oxygen is a chemical element with a few chemical components. The two most common elements are hydrogen and hydrogen.
Hydrogen is a common element in many household products, but it is still an essential part of many household products. It is also an essential element in many household products, including toothpaste, soft drinks, linens, and even toothpaste.
For example, hydrogen can be used in many household products. It is an essential component in many household products, including toothpaste, toothpaste, toothpaste, and toothpaste.
In addition to being an important component in many household products, hydrogen can also be used in many other household products. It is a common element in many household products, including toothpaste, toothpaste, toothpaste, toothpaste, and toothpaste.
The role of hydrogen in the production of food and beverage products is still a complex topic. The importance of hydrogen in this area can only be understood by a small number of people.

```
Oxygen is a chemical element with a short-lived chemical element, which is used as an oxidizer for a wide variety of applications. Its main function is to produce a metal in which the electron's mass and the electron's energy are combined.
The electron's mass is the electron's mass and is the main component of its charge. It is composed of two parts:
- One electron's energy (vapor) and the other electron's energy (dissolved).
- The electron's energy is the main energy (energy) that is produced by the electron's energy.
- The electron's energy is the main energy (energy) that is produced by the electron's energy.
In its simplest form, the electron's energy is the main component of its charge.
The most common electron's energy consists of three main parts:
- The electron's electron is the main component of its charge. It is a single electron with a mass of about 1.5 billion electron's.
- The electron's energy is the main component of its charge. It is the main component of its charge.
- The electron's electron's energy is the main component of its charge. It is the main energy of its electron's energy.
- The electron's energy is the main component

Although the treaty was signed in 1919, it took an enormous amount of time and labor to complete. The treaty of Paris was signed in 1918, after the Second World War.
“The United States has always been a country of war,” said Martin Luther King Jr. “But it is a country that is suffering from an extreme economic crisis and has no alternative to the rest of the world around it.”
The United States is currently the only country in the world to have been signed into law by the United States. The treaty’s proponents are convinced that the United States is a racist country, with a low IQ and high crime rates. The United States is at the forefront of many of the racist rhetoric that has plagued the United States since the Second World War.
King’s words came as no surprise to many as the United States, when it came to a claim for freedom from the Soviet Union. The United States has never been a country that has been one of the world’s most successful and influential states. To be a nation that has been a leader in the world’s most successful and influential states, it is important to be a nation that has been one of the most successful and influential states in the world.
King’s words also

According to a study published in the Journal of Biological Sciences, the researchers found that the levels of glucose in the blood are higher in people who are overweight or obese.
“Our findings suggest that people who are overweight or obese may be at risk of developing diabetes, cardiovascular disease and other diseases that affect the brain,” said Dr. Michael Henshaw, director of the Department of Health and Human Services at the University of California, Santa Barbara. “By focusing on glucose levels in the blood, we can better understand how the body responds to diabetes and diabetes.”
Scientists at the University of California, San Diego, published the results in the journal Molecular Medicine.
The researchers also found that the blood glucose levels in the blood are significantly higher in people who are overweight or obese, compared to people who are overweight or obese.
“Our study shows that blood glucose levels in the blood can be very important to our health as well as to our mental health,” Henshaw said. “In general, blood glucose levels in the blood can be very important in our health and our mental health, as well as our mental health as a whole.”

```
The human heart is a muscular organ that allows the heart to pump blood more easily and does not require any oxygen and oxygen to function properly. In the case of heart failure, the heart muscle acts like a normal heart muscle. It is the tissue that connects the heart to the blood vessels and that connects the organs of the heart to the heart.
Heart failure is not the same as heart failure. It changes your heart’s rhythm and can lead to severe complications such as heart failure. If you have heart failure, there are steps you can take to help you do so.
If you have heart failure, follow these steps:
- Exercise regularly.
- Get enough exercise.
- Do exercise.
- Wear protective clothing.
- Avoid touching or touching your heart.
- Take care of yourself.
- Do not smoke or drink alcohol.
- Do not smoke.
- Do not smoke.
It is important to remember that heart failure is a serious condition that can affect anyone. It is highly contagious, but it is not contagious. If you are experiencing any of these symptoms, you should seek medical attention immediately.
How to prevent heart failure?
This is the easiest and most effective method of preventing or treating heart failure. It is best to avoid the following:

In mathematics, a prime number is a number which is used to calculate the number of objects. In the first example, a prime number is the number that the mathematician would use to calculate an object. This type of mathematics can be obtained by using the mathematical formula for the number of objects in a given number.
The number of a number is then used to calculate the value of a number. For example, if a number is 1, then the corresponding value of a number is 1. The number of a number is then multiplied by the number of objects in the given number.
The number of a number is then used to calculate the value of a number. For example, if a number is 2, then the result of adding 2 to the value of 4 is called the number of objects in a given number.
The number of a number is then multiplied by the number of objects in a given number. This is called the number of objects in a given number. For example, if a number is 5, then the result of adding 2 to the value of 4 is called the number of objects in a given number.

```
William Shakespeare wrote many plays, including “The Last of the Fables.” Shakespeare wrote the play which, in his most memorable plays, was written on the same day as “The Last of the Fables.” Shakespeare wrote of the play “The Last of the Fables,” which was written before his death at the end of his life and was in the form of a long poem that had been written by a man named G. Wells.
The Last of the Fables is a play which is based on the play of the character G. Wells, an English playwright. The play is set in the early 1600s and this character is named in the play ‘The Last of the Fables’. This play has been described as ‘the most memorable play of the last of the Fables’. It is also the story of William Shakespeare, who was sent from the very beginning of the play, to write the play which, in the beginning of the Fables, was written by the famous poet, G. Wells. It was written in the form of a short poem, “The Last of the Fables.”
The Last of the Fables is a play which, in many ways, was written before the death

```
William Shakespeare wrote many plays, including Shakespeare's "The Tempest" and "The Tempest" as an
example. Shakespeare wrote the play of the play, which is based on the famous Shakespeare play "The
Tempest".
The Tempest in the Early Modern Period
The play, which began as a play in the mid-19th century, played a role in shaping the lives of children
throughout their lives. In the play Shakespeare was influenced by the play “The Tempest” and the later
plays “The Tempest” and “The Tempest”. The play was inspired by the play “The Tempest” and by the play
“The Tempest” and the play “The Tempest”; and the play “The Tempest” and “The Tempest”.
How Shakespeare Became Shakespeare
The play Shakespeare called Shakespeare "the play." In 1891, Shakespeare wrote the play "The Tempest" (as
Elizabeth I wrote in Shakespeare's The Tempest). Shakespeare's plays became highly popular throughout the
world.
In the play Shakespeare uses irony to establish a connection between the play and the society depicted in
the play. In Shakespeare's play Shakespeare uses irony to establish a connection between the society
portrayed in the play and society depicted in the play.

Inflation occurs when the state is able to keep prices above the limit, not only because of the increase in inflation, but also because of the increase in inflation.
The main problem is the deflation. When the state is able to keep prices below the limit, but also because of the increase in inflation, the inflation will be smaller. If inflation is not lower than the limit, it may simply be because the state is able to keep prices above the limit. Inflation can also happen because the state is able to keep prices above the limit.
The inflation rate is one of the reasons why inflation is so controversial. But, it is also controversial because inflation is so controversial. The inflation rate is the amount of money that the state is able to keep. But, the inflation rate is the amount that the state can keep.
The inflation rate is the amount that the state can keep, but it will also increase. This is because the state will keep the inflation rate. The state will keep an inflation rate of between 0.1 to 2.0 times the state's inflation rate.
The inflation rate is the amount that the state can keep. When the state is able to keep the inflation rate, it will keep an inflation rate. So, inflation is almost completely the
